
PBBET: Next-Gen iGaming Ecosystem

Comprehensive Project Development Proposal & SLA

Inspired by the robust B22 framework and powered by OroPlay's industry-leading live casino, slot, and mini-game integration suite.

PREPARED FOR:	iGaming Acquisition Client
PREPARED BY:	Rakibul Hasan
TECHNICAL STACK:	React.js / Next.js, Node.js, MySQL / MongoDB
LIVE PREVIEW URL:	https://bdclient011.pages.dev
INTEGRATION TARGET:	OroPlay API (Seamless & Transfer Wallet)
DATE:	May 2026

1 Executive Summary & Project Vision

The target of the **PBBET Project** is the development and deployment of a state-of-the-art iGaming ecosystem. Modeled after leading industry paradigms such as PBC88 and Betkhala, the platform combines intuitive, high-performance visual layouts with a secure, highly scalable backend engine.

To ensure absolute transparency and facilitate continuous feedback, we have established a real-time deployment window. The client can track ongoing progress, design paradigms, and frontend system architecture live at:

<https://bdclient011.pages.dev>

1.1 Core Development Pillars

- **Premium Dark-Themed UI/UX:** Built for maximum retention with mobile-first responsiveness, smooth micro-interactions, neon gradients, and professional betting slips.
- **Secure Core Framework:** Comprehensive auth systems (JWT), secure financial callbacks, and anti-fraud monitoring to establish 100% transaction integrity.
- **Unified API Management:** Native compatibility with OroPlay's world-class gaming aggregation framework for Live Casino, Slots, and proprietary Mini Games.

2 Premium Technology Stack

The platform's architecture is selected to deliver low latency, rapid data ingestion, dynamic state management, and robust concurrent connection limits.

Table 1: Platform Stack Allocation

Layer	Technology	Architectural Function
Frontend	React.js / Next.js	Lightning-fast Server-Side Rendering (SSR), SEO, & responsive layout
Backend	Node.js / Express	Dynamic transaction routing, secure auth systems, & low-latency API
Database	MySQL / MongoDB	Hybrid structured transactions ledger & high-throughput game log i
Integration	REST / WebSocket	Real-time callbacks with OroPlay wallet systems.

2.1 Key Modules to Be Handled

1. **User Panel:** Dynamic multi-currency wallets, instant player registration, real-time live game launch modules, and automatic promotional tracking.
2. **Admin Panel:** Granular control over game availability, real-time user management (KYC, account statuses), custom RTP adjustments, and deposit/withdrawal processing.
3. **Affiliate Engine:** Referral code distribution, multi-tier agent commissions, and lifetime-value (LTV) dashboard logs.

3 OroPlay API Core Integration

Our implementation strictly maps to the latest **OroPlay API v1.1.1** standards, guaranteeing complete support for both Seamless Wallet and Balance Transfer architectures.

3.1 Seamless Callback Implementation (Operator End)

We will implement and host the required callback listeners to process player requests smoothly:

- **POST /api/balance:** Securely retrieves real-time user balances using Basic Auth headers.
- **POST /api/transaction:** Handles real-time bet/win transactions (debits/credits) with duplicate request protection to prevent double-spending ('DUPLICATE_TRANSACTION').
- **POST /api/batch-transactions:** Processes high-frequency batch transactions, perfect for rapid fishing and multiplayer mini-games.

3.2 Transfer Wallet & RTP API Integrations

To give the admin total control over game performance, our backend links directly to OroPlay's administration endpoints:

- **RTP Control (Real-Time):** Integration of real-time Return to Player settings (values 30% to 99%) for specific vendors, single users ('POST /game/user/set-rtp'), or batch adjustments up to 500 players ('POST /game/users/batch-rtp').
- **Auto-Call Suite Integration:** Fully supports configured auto-call rules based on key metrics (Auto-Call Percentage, Maximum daily payout caps, Trigger balances, and Total bet size triggers).
- **Detailed Betting History V2:** Built-in support for retrieval parameters matching modern UTC formats ('by-date-v2'), processing logs up to 7 days old with automatic cursor pagination via 'nextStartDate'.

4 Deployment Roadmap & Visual Process

We operate on an agile, rapid development cycle, deploying iterative visual updates to the demo site so you can inspect progress regularly.

4.1 25-Day Project Lifecycle

- **Days 1–5: Core Setup & UI Design**
 - Database structuring, authentication middleware (JWT), and system core configuration.
 - Initial high-fidelity responsive layout deployed on bdclient011.pages.dev.
- **Days 6–15: Backend & API Integration Framework**
 - Full backend implementation (Node.js/Express) and user routing logic.
 - Completion of interactive lobby dashboard, game listing components, and mock transaction logic.
 - **Day 15 Project Showcase & Briefing** (See Section 6).

- **Days 16–20: Payment Gateway & Bonus Logics**

- Integration of Seamless Wallet callback systems with production OroPlay endpoints.
- Dynamic financial approval workflows, bonus automation engine, and rebate calculations.

- **Days 21–25: QA, Security Hardening & Handover**

- Load testing for high-concurrency wallet operations.
- Production environment configuration, security audits, and formal deployment.

5 Deployment & Infrastructure Requirements

Upon completion of testing and approval, the developer will submit the complete system repository, build artifacts, and database structures.

5.1 Client Infrastructure Provisions

If the client requests the developer to handle ongoing server maintenance, hosting operations, or active production deployment, the client must provide the following dependencies:

- **High-Speed Cloud VPS:** A dedicated Virtual Private Server (VPS) matching production workloads, pre-configured with active DDoS protection to handle peak transaction hours safely.
- **Paid Database Services (If Applicable):** Dedicated subscriptions, server resources, or licenses for production-level instances (MySQL/MongoDB) as necessary to guarantee zero-downtime ledger stability.

6 Commercial & Payment Structure

This project is structured around a dual-phase delivery model, tied directly to visual confirmations of platform progress.

Table 2: Project Milestones and Payment Terms

Milestone	Deliverable & Process Verification	Associated Payment		
Milestone 1	Project Initiation & UI Setup Initial framework configuration, live staging environment launched, and core layouts.	Project Start		
Milestone 2	Day 15 Progress Showcase & Briefing Mid-project milestone review. Complete presentation of interactive design, working wallets mock-ups, and structural systems viewable live at bdclient011.pages.dev .	Advance Payment (Negotiable Amount)		
Milestone 3	Final Production Deployment & Handover Full OroPlay integration, callback setup, database migration, and formal handoff.	Remaining	Balance	Payment

6.1 Approval Process

All project milestones require explicit digital sign-off from the client. The Day 15 review will occur via an interactive walk-through on the staging domain. Once confirmed, development will proceed to production wallet integration immediately upon receipt of the Milestone 2 advance payment.
