

Gaming Platform Project Proposal

Dear Client,

Thank you for sharing your project requirements and the API documentation. Based on your requirements, I will develop a professional gaming platform with user, admin, and affiliate management, API integration, wallet-related workflows, and a responsive web design.

The project design and development progress can be reviewed here:

<https://bdclient011.pages.dev>

Project Idea

My plan is to build a modern gaming platform that is secure, scalable, and easy to manage. The website will be designed with a professional and mobile-friendly interface so users can access the platform smoothly from desktop and mobile devices.

The platform will include separate sections for users, administrators, and affiliates. The user side will focus on registration, login, wallet/balance display, and game access. The admin side will help manage users, games, financial approvals, and platform settings. The affiliate side will help manage agents, referrals, and commission-related information.

Main Features

- User registration and login system.
- Secure authentication using JWT.
- User dashboard with wallet and balance information.
- Admin dashboard for managing users, games, and financial requests.
- Affiliate/agent panel for referral and commission management.
- Game provider and game list integration using the provided API documentation.
- Deposit, withdraw, balance, and transaction workflow planning.
- Mobile responsive design for all important pages.
- Clean backend structure for future updates and maintenance.

API Integration

I reviewed the OroPlay API documentation. The project will be planned to support the required API areas, including token creation, vendor list, game list, game details, balance, deposit, withdraw, and transaction-related workflows.

All API requests that need security will be handled from the backend side. The frontend will not directly expose sensitive API credentials. Rate limits and token handling will also be considered during development.

Technology Stack

Part	Technology
Frontend	React.js / Next.js
Backend	Node.js / Express
Database	MySQL / MongoDB, depending on the final project requirement

Authentication	JWT based secure login system
API Integration	OroPlay API and other required third-party APIs

Development Process

I will first complete the project structure, UI design, database planning, and core module setup. After that, I will work on the backend system, API integration, admin panel, user panel, affiliate panel, and testing.

After 15 days of project work, I will provide a brief progress update. At that time, you will be able to review the project design and progress through the website link:

<https://bdclient011.pages.dev>

Payment Terms

On the 15th day of the project, after I provide the progress brief and you review the design/progress, an advance payment will be required to continue the next phase of the project. The advance amount can be discussed and negotiated between us.

After the final delivery of the project, the remaining full payment will be required. Final source code, production files, and complete handover will be provided after the final payment is completed.

Hosting and Deployment

I will submit the completed project to you. If you want me to host or deploy the project for you, you will need to provide the required VPS/server access.

If a paid database, managed database, domain, SSL, premium API service, or any other paid third-party service is required, you will need to provide or pay for those services. I can help with deployment after the required access and services are provided.

Client Responsibilities

- Provide API credentials and required provider access when needed.
- Provide hosting/VPS/database access if production deployment is required.
- Review progress and provide feedback during the project.
- Confirm any additional features that are outside the initial scope.

Final Delivery

At the end of the project, I will deliver the completed web application, backend system, database structure, and necessary setup information. The final project will be built professionally so it can be maintained, updated, and deployed properly.

Thank you.
